New Notify Requirements

° **SDHL has recently integrated the CMPI (Community Master Patient Index) in Notify. This will return better matching rates for our Notify End-Users.**

  o CMPI integration allows for matching to happen based on a members catalog of patient demographics from across the entire SDHL community. For instance, if you have an old address listed on your patient list, the CMPI will "look" back through old addresses in the CMPI catalog to ensure this was a previous address, thus allowing you to receive a match you may not have previously received.

  o CMPI integration further ensures the privacy and security of information exchanged across the SDHL network.

° **Patient list requirements have changed and now <u>MUST</u> include the following:**

  o First name

  o Last name

  o DOB

  o Gender

  o Phone Number

° **Patient <u>Social Security Number is highly encouraged to be included</u>, but not required.**

  o If you have it, include it!

° **If you have not updated your Notify patient list since July 20, 2018, you must update the list to include all the patient list requirements listed above.**

  o If you do not update your current list to include the required elements your match rate will go **down** as Notify will default back to the strictest matching requirements where everything must be a 100% match.

  o For example: if a William is admitted to the hospital and presents himself as Bill or Will, but you have William in your patient list; you **will not** receive a match.

° **The more data you include, the better!**
